BRAMPTON ONTARIO L6S4J3

Critical Items List

SRMS

CIL Ref#: 2666

Revision: 0 **FMEA Rev:** 0

System: SRMS

Subsystem: ELECTRICAL SUB-SYSTEM

Assembly Desc: Servo Power Amplifier

Part Number(s): 51140F1177-3 51140F1177-5

Item:

Function: Analog Interface Assembly

Provides Tachometer excitation, SCU signal filtering, Phase Locked Loop and tachometer counter circuits to provide measured motor speed data to inner and outer rate loops. Provides analog to digital conversion of MDA buck output voltage, EPC +5V and reference voltages for BITE.

Failure Mode: Loss of one of Analog FPGAs

	H/W	Func.	Screen Failures
Criticality:	2	1R	

Mission Phase: Orbit

Cause(s): Analog Interface Assembly

Loss of U4 or U14 FPGA operation.

Failure effect on unit/end item:

Any or all analog interface functions are lost or corrupted. Tachometer data and A/D data may be corrupt, Direct drive digital filter clock and 1.6 MHz watchdog timer clock to CPU and Digital IF may be lost. Direct drive may be lost. Serial data communication may be lost.

Worst Case: Unexpected motion. Six joint runaway. Autobrakes.

Redundant Paths: Autobrakes (to Safe the System).
Direct Drive (If Available).
End Effector Auto mode (If Available).
Backup Drive and End Effector Manual mode.

Retention Rationale

Design:

The design utilizes proven circuit techniques and is implemented using CMOS logic devices. CMOS devices operate at low power and hence do not experience significant operating stresses. The technology is mature, and device reliability history is well documented. All stresses are additionally reduced by derating the appropriate parameters in accordance with SPAR-RMS-PA.003. Special handling precautions are used at all stages of manufacture to preclude damage/stress due to electrostatic discharge.

Resistors and capacitors used in the design are selected from established reliability (ER) types. Life expectancy is increased by ensuring that all allowable stress levels are derated in accordance with SPAR-RMS-PA.003. All ceramic and electrolytic capacitors are routinely subjected to radiographic inspection in accordance with the requirements of MSFC-STD-355

Test:

QUALIFICATION TESTS - The SPA is subjected to the following qualification testing:
VIBRATION: Each axis of the QM is subjected to Flight Acceptance Vibration Test (FAVT), Qualification Acceptance Vibration Test (QAVT), and Qualification Vibration Tests (QVT) in accordance with the SPA Vibration Test Procedure (826586). The level and duration for FAVT is as per Figure 6 and Table 2 of 826586; the level and duration for QAVT is as per Figure 7 and Table 2 of 826586; the level and duration for QVT is as per Figure 8 and Table of 826586. At the end of the three successive random vibration test in each axis, both directions (+/-) of each of the axis is subjected to a shock pulse test as per Figure 9 of 826586.
THERMAL/VACUUM: QM TVAC Test is in accordance with Figure 5 of the SPA TVAC Test Procedure (826588), with full Functional/Parametric Test performed at levels of +60 degrees C and -36 degrees C, and non-operating at -54 degrees C. The Qualification vacuum levels during TVAC is 1X10**-6 torr or less. The total test duration is 7 1/2 cycles. The QM SPA is subjected to a minimum of 1000 hours of life testing and 1000 power On-Off cycles.
EMC: The QM is subjected to EMC Testing (tests CE01/CE03, CE07, CS01, CS02, CS06, RE02, RS02, and RS03) in accordance with the SPA EMC test Procedure (826477) based on MIL-STD-461A.

UNIT FLIGHT ACCEPTANCE TESTS - The FM SPA is subjected to the following acceptance testing:
VIBRATION: FM Acceptance Vibration Test (AVT) in accordance with the SPA Vibration Test Procedure (826586), with level and duration as per Figure 6 and Table 2 of 826586.
THERMAL/VACUUM: FM TVAC Test is in accordance with Figure 6 of the SPA TVAC Test Procedure (826588), with levels of +49 degrees C and -25 degrees C for a duration of 1 1/2 cycles. The vacuum levels during Acceptance TVAC Test is 1X10**-5 torr or less.

JOINT SRU TESTS - The SPA is tested as part of the joints (ambient and vibration tests only). The ambient ATP for the Shoulder Joint, Elbow Joint, and Wrist Joint are as per ATP.2001, ATP.2003, and ATP.2005 respectively. The vibration test for the Shoulder Joint, and Elbow or Wrist Joint are as per ATP.2002, ATP.2004 and ATP.2006 respectively. Through wire function, continuity and electircal isolation tests are performed per TP.283.

MECHANICAL ARM REASSEMBLY - The SPA's/Joints undergo a mechanical arm integration stage where electrical checks are performed per TP.2007.

MECHANICAL ARM TESTING - The outgoing split-arm is configured on the Strongback and the Manipulator Arm Checkout is performed per ATP.1932.

FLIGHT CHECKOUT: PDRS OPS Checkout (all vehicles) JSC 16987.

Inspection:

Units are manufactured under documented quality controls. These controls are exercised throughout design procurement, planning, receiving, processing, fabrication, assembly, testing and shipping of the units. Mandatory inspection points are employed at various stages of fabrication, assembly, and test. Government source inspection is invoked at various control levels.

EEE parts inspection is performed as required by SPAR-RMS-PA.003. Each EEE part is qualified at the part level to the requirements of the applicable specification. All EEE parts are 100% screened and burned-in, as a minimum, as required by SPAR-RMS-PA.003, by the supplier. DPA is performed as required by PA.003 on a randomly selected 5% of parts, maximum 5 pieces, minimum 3 pieces for each lot number/date code of parts received. All cavity devices are subjected to 100% PIND. Wire is procured to specification MIL-W-22759 or MIL-W-81381 and inspected and tested to NASA JSCM8080 Standard Number 95A.

Receiving inspection verifies that all parts received are as identified in the procurement documents, that no physical damage has occurred to parts during shipment, that the receiving documents provide adequate traceability information and screening data clearly identifies acceptable parts.

Parts are inspected throughout manufacture and assembly as appropriate to the manufacturing stage completed. These inspections include:

Printed circuit board inspection for track separation, damage and adequacy of plated through holes, component mounting inspection for correct soldering, wire looping, strapping, etc. Operators and inspectors are trained and certified to NASA NHB 5300.4(3A-1) Standard. Conformal coating inspection for adequate processing is performed using ultraviolet light techniques. P.C. Board installation inspection includes checks for correct board installation, alignment of boards, proper connector contact mating, wire routing, strapping of wires etc. Post P.C.

Critical Items List

SRMS

CIL Ref#: 2666

Revision: 0 **FMEA Rev:** 0

[redacted]MRSD Online Installation: None.

OMRSD Online Turnaround: Power-up arm. Verify no BITE errors . Select Direct Drive and verify that joint is attempting to drive.

Screen Failure: A: Pass
B: Pass
C: Pass

Crew Training: The crew will be trained to always observe whether the arm is responding properly to commands. If it isn't, apply brakes.

Crew Action: Select Direct Drive if available. If D/D not available select Back-up Drive. Use EE Manual Mode. Single/Direct Drive switch should be pulsed to maintain proper rates.

Operational Effect: Cannot use Computer Supported modes. Direct Drive may not be available. Autobrakes. Back-up is available. Arm will not stop automatically if failure of the autobrake system has previously occurred. Brakes can be applied manually. EE Auto mode is unavailable.

Mission Constraints: Operate under vernier rates within approximately 10 ft of structure. The operator must be able to detect that the arm is responding properly to commands via window and/or CCTV views during all arm operations. Auto trajectories must be designed to come no closer than approximately 5 ft from structure.
